REG. NO : 192524415
COURSE : CSA1515 (Cloud computing)

CO1 - SHORT ANSWER TEST

1. Define cloud computing & explain any four characteristics that make it different from traditional on-premise computing.
2. Evolution of cloud computing from hardware evolution to internet Software.
3. Role of Server Virtualization in cloud computing.
4. Role of Data centres in cloud Services.
5. Iaas, Paas, Saas & xaas.

Answers :

1. CLOUD COMPUTING :

→ cloud computing is a technology used to access datas, Software, Hardware anywhere at anytime through internet.

→ It enables the users to access the data that are stored in data centres like in large scale.

→ The storage can be accessed or purchase as much as it's usage.

2) EVOLUTION OF CLOUD COMPUTING:

→ The sharing of data's and storage in large amount takes more time and energy consuption.

→ Therefore it requires a solution called cloud computing.

→ Which shares the resources like CPU, Memory, datas, Hardware from anywhere in a world to everywhere.

→ The cloud computing companies like AWS, Oracle, OneDrive, provides cloud storage to get access the data centres and store datas in there.

→ The datas that are stored will be accessed only through internet.

3> SERVER VIRTUALIZATION:

→ Server Virtualization is the concept that used to handle the memory efficiently.

→ It allocates the developer with the only amount of memory size required.

→ It will deallocate the memory and passes for upcoming tasks to be performed.

→ The unused $ or unwanted ## data or a files will get minimized to for memory mangement purposes.

4> ROLE OF DATA-CENTRE:

→ The Data-centers are used the hardware storage, where large amounts of storge devices where manged.

→ It will get accesses through the cloud data Services as part of ~~data~~ cloud computing data sharing.

→ It share the storgage devices to the developers.
